What does LED stand for?

Light Emitting Diode.

Incandescent vs. LED

An incandescent lamp is essentially a piece of wire in a bottle. Every incandescent lamp contains a tungsten filament. When current flows through the filament, it encounters resistance and the wire heats and glows very brightly. Overtime the tungsten evaporates and the filament wire burns out. This failure can occur between 200 and 15,000 hours – depending on the type of bulb and the environment it is exposed to.

An LED is a solid state electronic component. When current flows through the semi-conductor compounds, light is emitted. Because there is no evaporation of components and it is solid, LED service life is significantly longer. On average, LEDs remain effective for approximately 100,000 hours which equals running for 24 hours a day for 11 years.

Major Benefits of LED's

SAFETY

LEDs turn on instantly. An LED illuminates 2/10's of a second faster than incandescent lamps. If a vehicle was traveling at 65mph behind an LED stop lamp, the driver would have an additional effective stopping distance of 15-24 feet.

LOWER AMPERAGE DRAW

The average LED stop lamp requires 0.5 amps at 12.8 volts, and a typical incandescent stop lamp requires 2.1 amps. A standard trailer outfitted with incandescent lamps draws 18.02 amps. The same trailer outfitted with LED lights draws 2.85 amps. That's approximately 84% less current draw by using LED lights.

LONGEVITY

LED's remain effective for approximately 100,000 hours. LEDs have no element to fail. Since an LED is a solid state electronic component it is not susceptible to vibration.

The Number #1 Reason Lamps Fail is Due to Vibration

A. Corrosion in the terminals causes the bulb to short out.

The Number #2 Reason of Lamp Failure is Connection Related

B. Waterproof connections are necessary for long life.

Design

LIGHT OUTPUT

Evaluate the LED that offers the best Diode-to-Light output ratio.

COMPATIBILITY PROBLEMS

LEDs that are not interchangeable with existing incandescent lamps and connectors add unnecessary costs.

You Get What You Pay For

FACT – 16% of failures are caused by poor connections

FACT – The diode will last 100,000 hours but the lamp may not

Evaluate the construction

Evaluate the terminals

FACT – Over 85% of the cost of a lamp is in the maintenance costs.

FACT – Design and reliability are the most important criteria for selecting LEDs

Questions You Should Ask When Selecting A LED

1. Are there ways for the circuit board to short out?
2. Are the circuit boards potted?
3. Do the terminals act as an open door for corrosion?
4. Are the terminals designed to last the life of the diodes?

A.L. Lightech answers all these questions
